## **VOLUNTARY ANNOUNCEMENT**

### **PHASE I CLINICAL TRIAL OF CU-20401 (RECOMBINANT MUTANT COLLAGENASE) FOR ABDOMINAL ADIPOSE ACCUMULATION COMPLETED DATABASE LOCK**

This announcement is made by Cutia Therapeutics (the “**Company**”, together with its subsidiaries, the “**Group**”) on a voluntary basis to inform the shareholders and potential investors of the Company about the latest business advancement of the Group.

The board of directors (the “**Board**”) of the Company is pleased to announce that Phase I clinical trial of CU-20401 (recombinant mutant collagenase), a potential Class I new drug of the Group, for abdominal adipose accumulation, has completed database lock.

CU-20401 is a recombinant mutant collagenase that targets obesity, overweight, or other localized adipose accumulation associated metabolic diseases. CU-20401 adopts an alternative mechanism of action where it acts as a collagenase to selectively act on fat cells attached to the extracellular matrix of adipose tissue. After localized injection, CU-20401 degrades extracellular matrix collagen in the subcutaneous fat layer which leads to apoptosis of adipocytes, and is expected to effectively reduce localized adipose accumulation. CU-20401 is technologically modified with reduced rate to catalyze the collagen degradation with mild catalytic activity, thus reducing the adverse effects of wild-type collagenase, such as bruising and pain.

The Phase I clinical trial of CU-20401 for abdominal adipose accumulation conducted in China was a single-center, open label, placebo-controlled and dose escalation trial to evaluate the safety and tolerability of CU-20401.

**Warning:** There is no assurance that CU-20401 will ultimately be successfully developed and marketed by the Company. Shareholders and potential investors of the Company are advised to exercise caution when dealing in the shares of the Company.

By order of the Board
